 @fr0gger_

Agenda

- Introduction
- Incident Response
- Threat Intelligence
- Threat Hunting

279 days

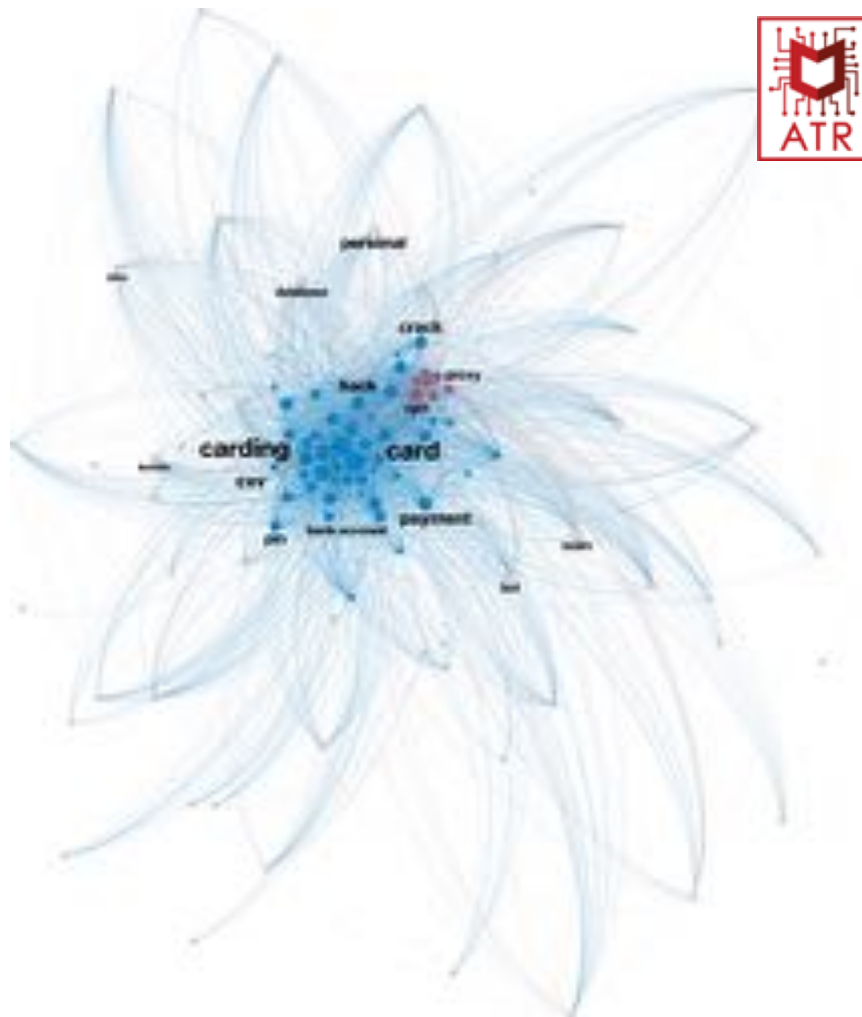

Security Incidents Facts

41,686 security incidents reported in 2018

2,013 of them were data breach

Security Incidents Facts

- Threat Actors Motivations:

Money is one of the most dominant motivation

Espionage is used to steal industrial secrets or is motivated by politic

Within minutes a breach happens, within an hour the data is exfiltrated

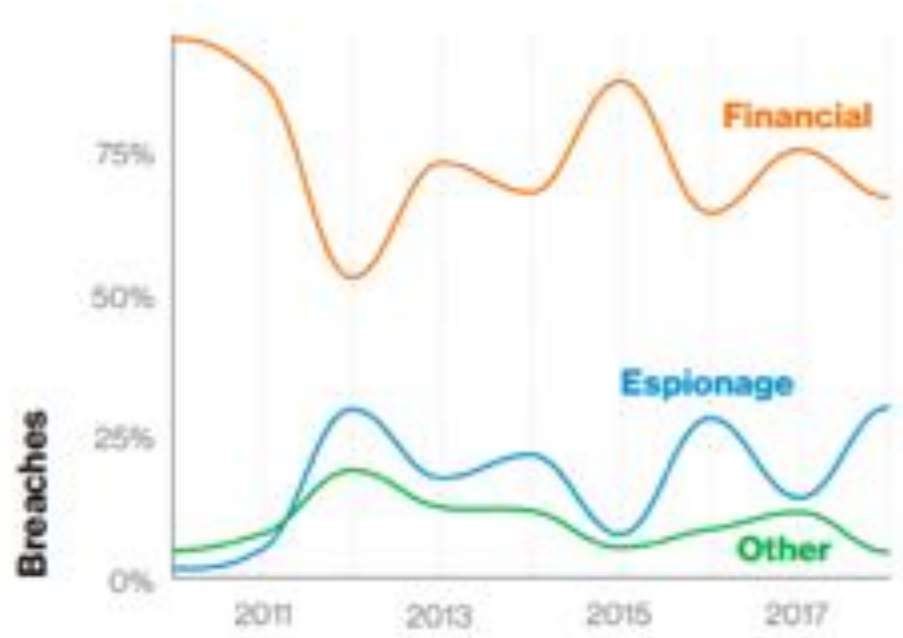

Figure 7. Threat actor motives in breaches over time

Security Incidents Facts

- The average cost of a data breach is \$3.9 million
- Attackers are gaining more capabilities over the time
- Attacks are more complex than ever
- Incident Response is a process to contain and understand a breach.
- Threat Intelligence is a process that can leverage and improve your protection capabilities.

What You Will Learn

Skills and Knowledge

- Attack steps
- Incident Response Process
- Threat Intelligence and Threat Hunting
- YARA Hunting

Incident Response

What is a Security Incident?

A security incident is an event that leads to a violation of an organization's security policies and puts sensitive data at risk of exposure.

These include but are not limited to:

- Attempts (either failed or successful) to gain unauthorized access to a system or its data.
- Unwanted disruption or denial of service.
- The unauthorized use of a system for the processing or storage of data.
- Changes to system hardware, firmware, or software characteristics without the owner's knowledge, instruction, or consent.

What is an Incident Response?

Incident response is a term used to describe the process by which an organization handles a data breach or cyberattack, including the way the organization attempts to manage the consequences of the attack or breach (the “incident”).

Ultimately, the goal is to effectively manage the incident so that the damage is limited and both recovery time and costs, as well as collateral damage such as brand reputation, are kept at a minimum.

Why Incident Response is Crucial?

"This is not IF, but WHEN you will be attacked!"

Protect your
Business

Protect your Data

Protecting data assets throughout the incident response process includes countless tasks and responsibilities for the IR team.

Protect your Reputation

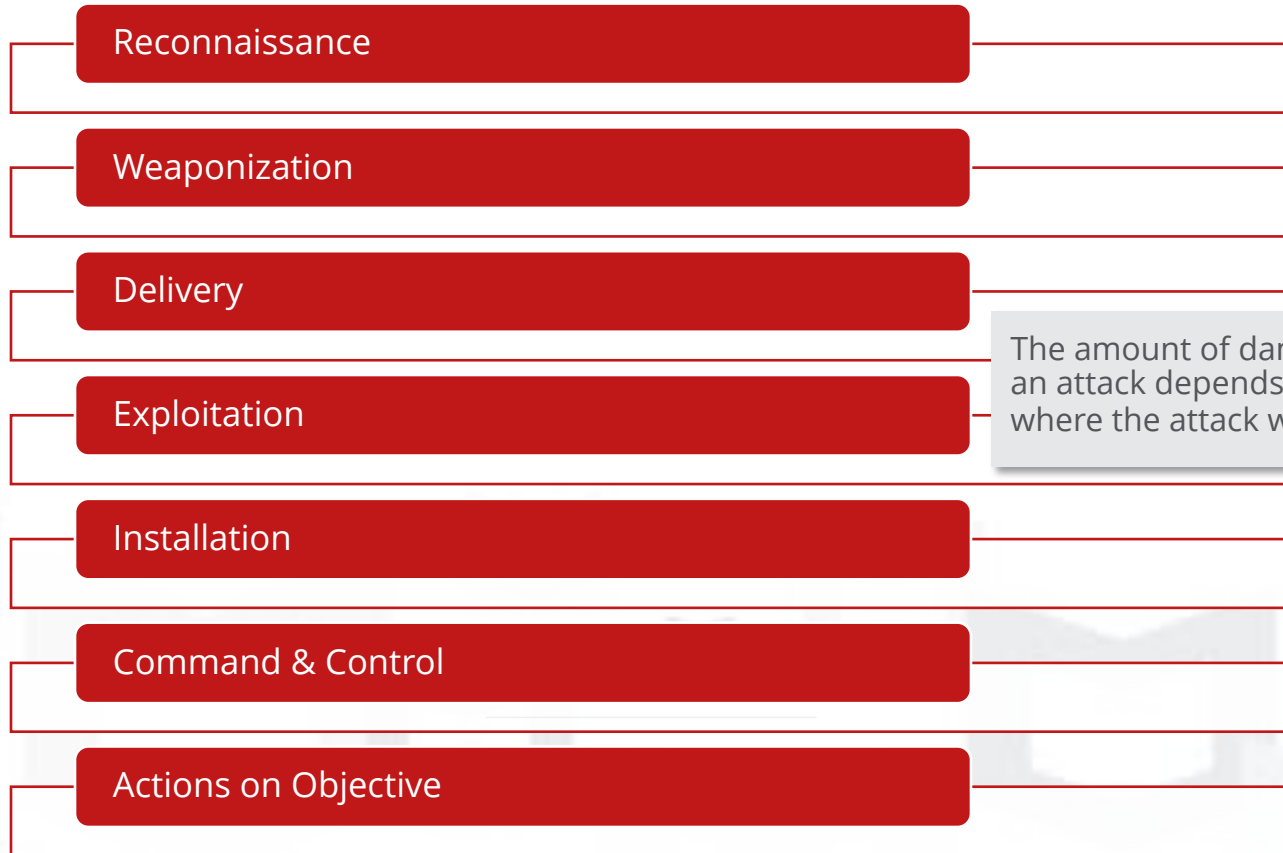

If a security breach is not properly handled quickly, the company risks losing some or all its customer base. A data breach doesn't instill confidence in your customers.

Protect your Revenue

A thorough incident response process safeguards your organization from a potential loss of revenue. .

Attackers Operation: Intrusion Kill Chain

The amount of damage caused by an attack depends on the stage where the attack was detected.

Kill Chain

Stage 1 - Reconnaissance

- Attacker collects information about the targeted organization:
 - Passive Reconnaissance
 - Social Media information
 - Public website
 - Available information
 - Google Dork
 - Whois, DNS...
 - Active Reconnaissance
 - Structure of organisation
 - Scan open ports
 - Security vulnerabilities

Kill Chain

Stage 2 - Weaponization

- Attacker uses information obtained during the Reconnaissance stage to determine how the attack must be performed.
 - Vulnerability Exploitation
 - Selection of the payload

Kill Chain

Stage 3 - Delivery

- Attacker delivers the exploit to the targeted organization.
 - Spam containing malicious attachment or link
 - Waterholing

Kill Chain

Stage 4 - Exploitation

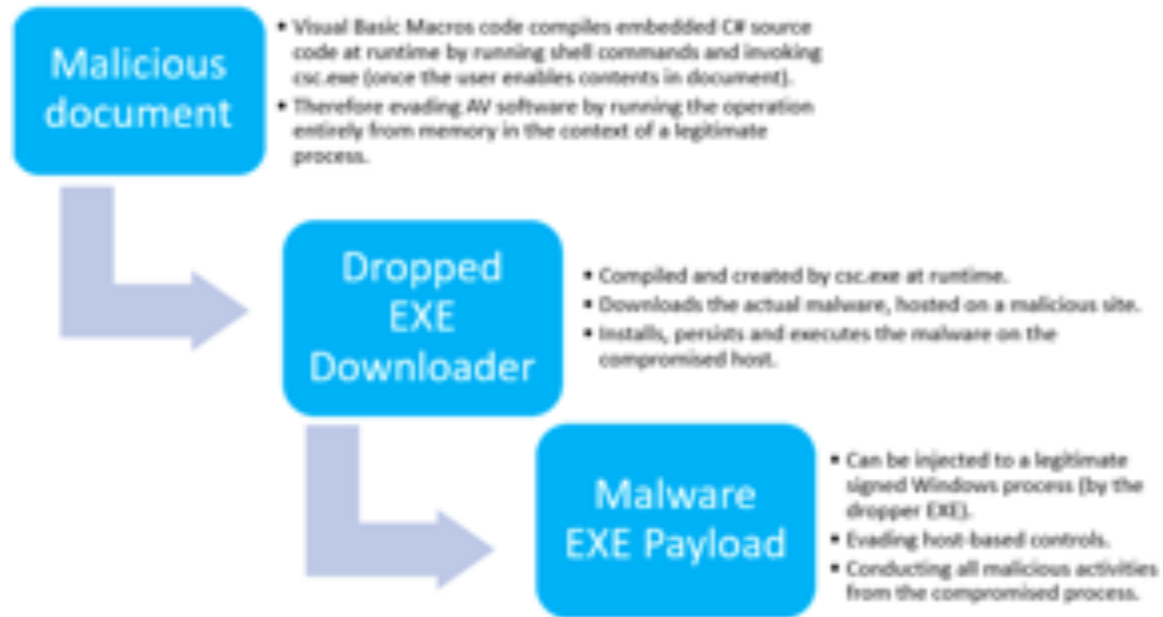

- At this stage, the exploit takes advantage of the discovered vulnerabilities and delivers the payload.

Kill Chain

Stage 5 - Installation

- At this stage, the payload installs itself, and tries to hide its activity to avoid detection or deletion.

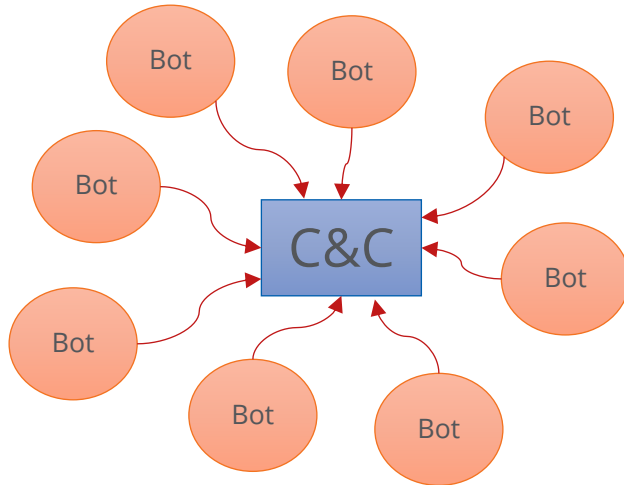

Kill Chain

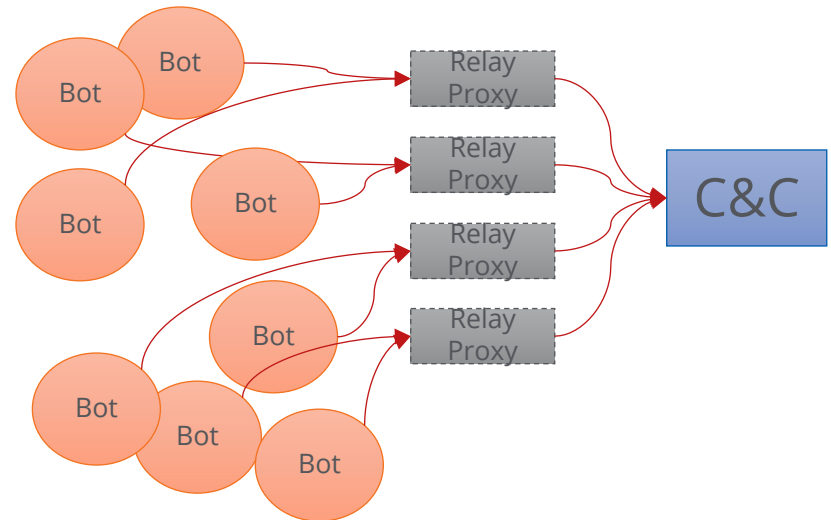

Stage 6 – Command and control

- At this stage, the payload waits for incoming commands from the attacker.

Centralized Architecture

Centralized Distributed Architecture

Kill Chain

Stage 7 – Actions on Objective

- At this stage, the attacker uses the payload and other software that was downloaded in the course of the attack to achieve the goals of the attack.
- Once the attacker compromises one of the organization's assets, he or she will try to steal, change, or destroy data available on the compromised asset.

Financial

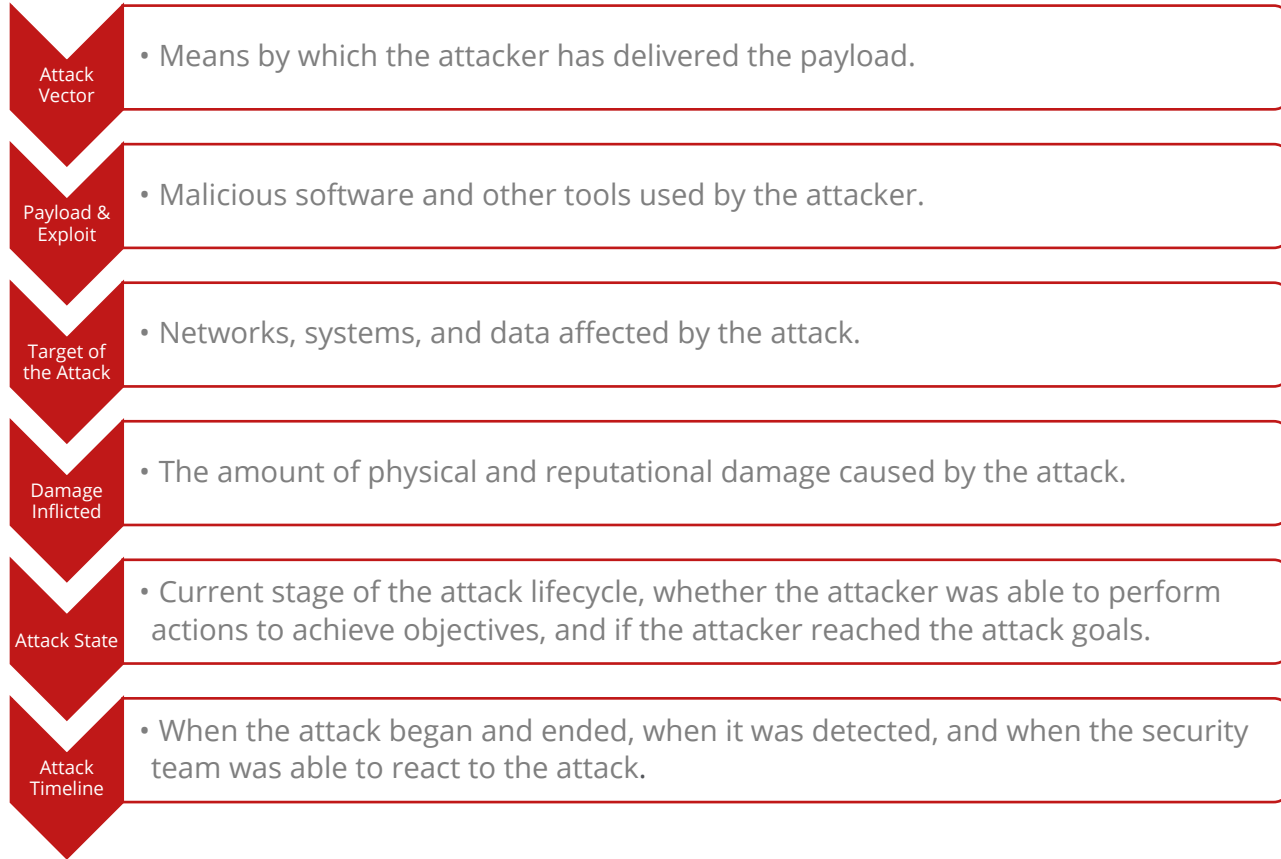

Espionage

Sabotage

Incident Response Goals

Incident Response Process

- The process of incident response includes the following phases:

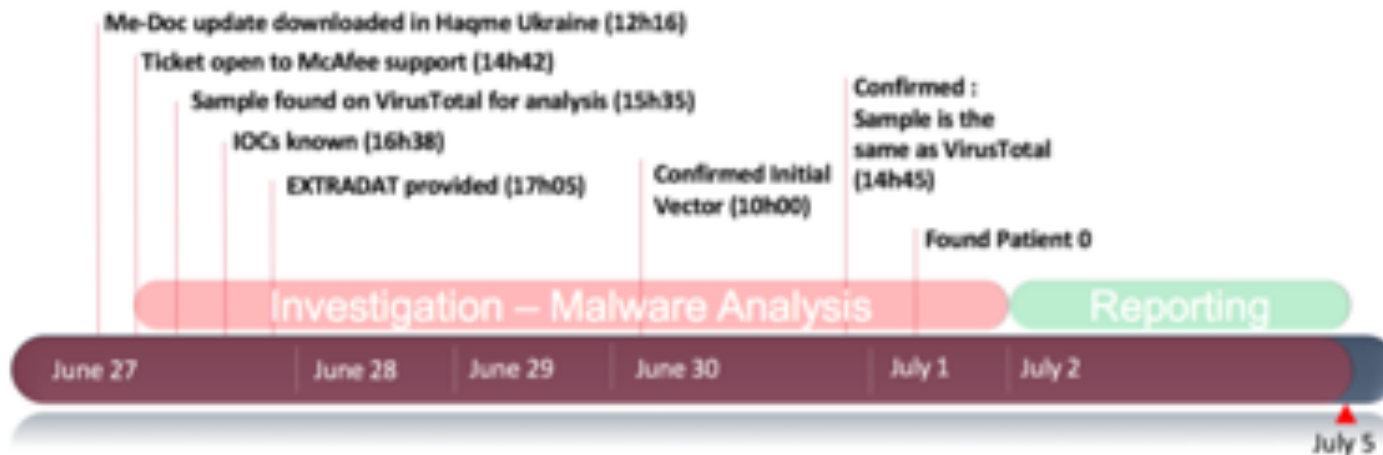

NotPetya

Timeline

- Incident Response

NotPetya

Identification

- Context collection – First at the incident (tension, pressure...)

```
If you see this text, then your files are no longer accessible, bec  
have been encrypted. Perhaps you are busy looking for a way to rec  
files, but don't waste your time. Nobody can recover your files w  
decryption service.  
  
We guarantee that you can recover all your files safely and easily.  
need to do is submit the payment and purchase the decryption key.  
  
Please follow the instructions:  
  
1. Send $388 worth of Bitcoin to following address:  
  
1Hc71538Mx0CTaR2R1t7Bv6G3dza@tHbBdX  
  
2. Send your Bitcoin wallet ID and personal installation key to e-m  
housmith123456@posteo.net. Your personal installation key:  
  
XDEGc2-7FRHBE-3vNFMp-z88UvG-uF5ahF-4uzo42-XdHrr6-FY088B-xk4rNz-9

Threat Intelligence

What is Threat Intelligence?

Threat intelligence is knowledge that allows you to prevent or mitigate cyberattacks.

Rooted in data, threat intelligence gives you context that helps you make informed decisions about your security by answering questions like

- who is attacking you?
- what their motivations and capabilities?
- what IOC in your systems to look for?

Threat Intelligence

What is Threat Intelligence?

- This intelligence can be used to inform decisions regarding the subject's response to that menace or hazard.
- Threat intelligence is often broken down into three subcategories:

Threat Intelligence offers a key element of a **mature** Security Operations Center that seeks to move from a reactive to a proactive stance.

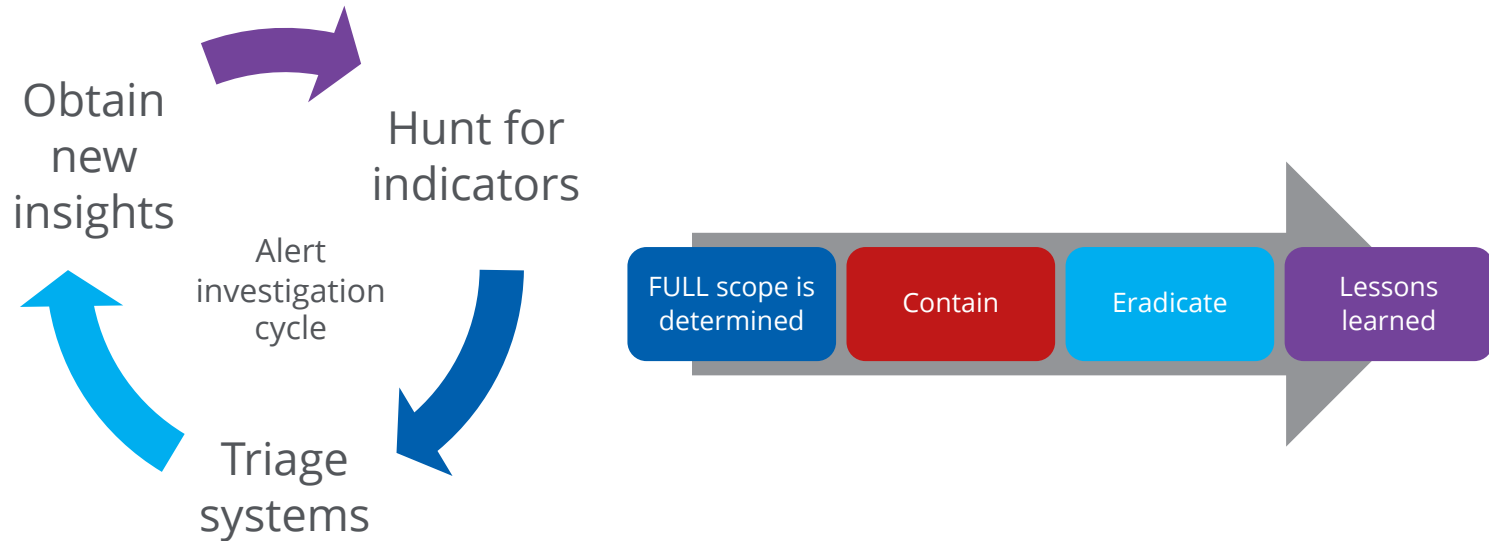

IR & CTI

Hunting & smart **incident response**

And why you shouldn't hunt on a Friday

Key findings from McAfee Threat Hunting Survey

Indicators of compromise typically used by threat hunters

Use of activity logs

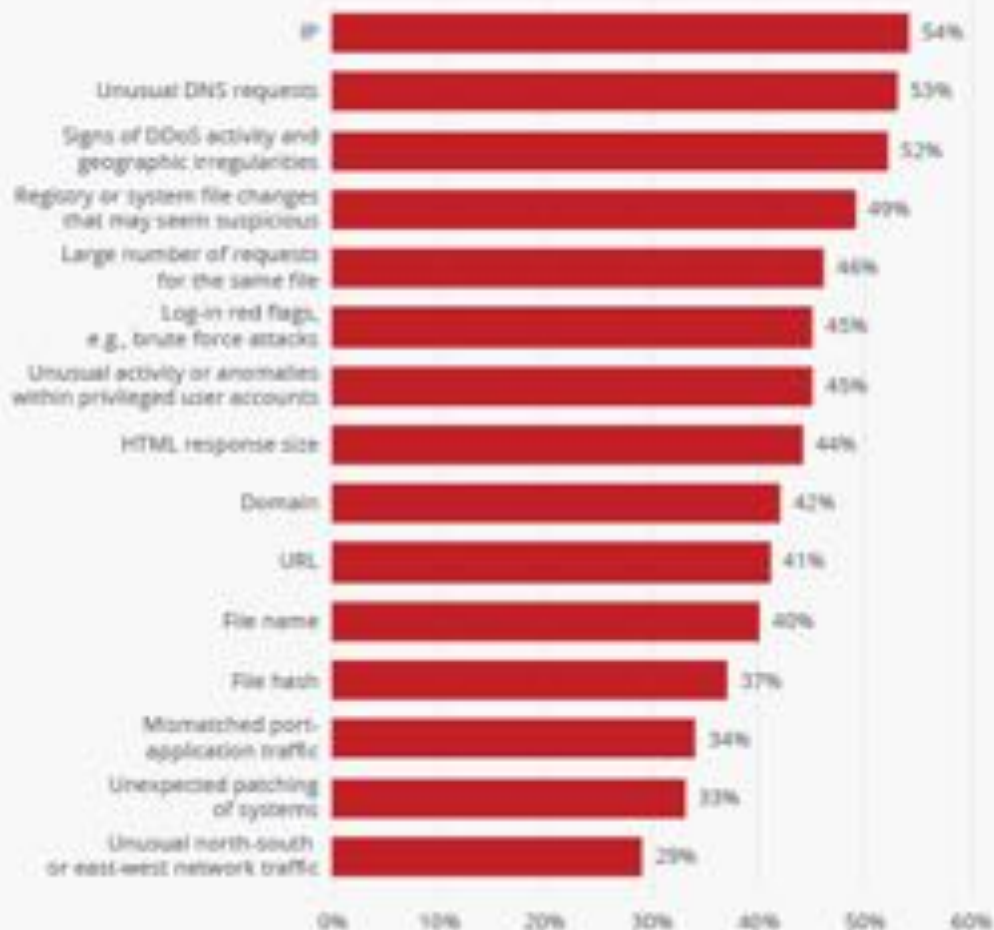

Log type	Percent of respondents
Firewall/IPS-denied traffic	70%
DNS	69%
Proxy	60%
Web and email filter	59%
Server	59%
Windows events (domain)	57%
Packet inspection (sniff)	45%

Figure 14: The most common logs used for threat hunting

Source: McAfee Threat Hunting Survey, May 2017

Source: McAfee Threat Hunting Survey 2017

Which of the following IOCs do you typically use for threat hunting?

Threat Intelligence

The Pyramid of Pain / Indicators Value

Source: <http://detect-respond.blogspot.com/2013/03/the-pyramid-of-pain.html>

Know the enemy

- We are not fighting binaries, but attackers with strong motivation
- Attackers can change IOCs very quickly, the fact someone has seen it doesn't mean you'll see it
- Essential to chose the right **hypothesis** and the right **questions** to gather context and think critically

Tactics, Techniques and Procedure

TTP is a military term describing the operations of enemy forces.

In InfoSec TTP is an approach for profiling and contextualizing cyberattack operations.

Tactics describes how an attacker operates during his operation.
(Infrastructure reused, amount of entry point, compromised targets...)

Techniques describes the approach used to facilitate the tactical phase.
(Tools used, malware, phishing attacks....)

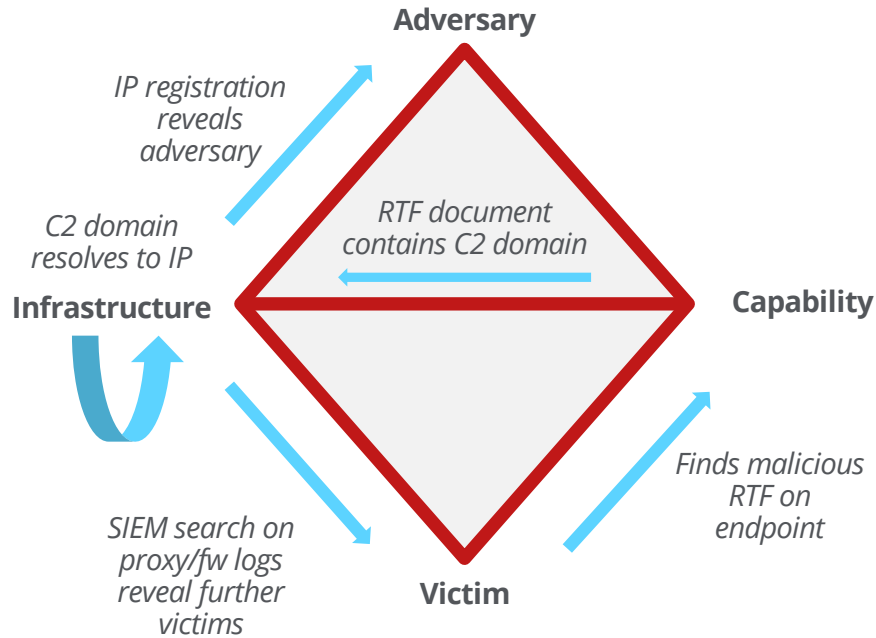

Procedures describes a special sequence of actions used by attackers to execute each step of their attack cycle.

Diamond Model of Intrusion Analysis

Different approaches for analytical pivoting

Focus on the adversary tactics, techniques, procedures (TTPs) and motivations.

Leverages threat intelligence to determine adversary's infrastructure and capabilities to hunt for attacker's IOCs & IOAs.

Investigation starts when evidence of an attack is found on the victim's network.

Analyst **inspects victim artifacts**, typically on an endpoint, to reveal the other components of the diamond

The MITRE ATT&CK model and tactics categories

https://attack.mitre.org/wiki/Main_Page

- The MITRE Att&ck Matrix is a table that groups and organizes post-exploitation tactics & techniques
- MITRE Att&ck Matrix testing is ONLY Visibility, NOT protection, performance nor usability.

How to apply the model?

MITRE ATT&CK

- RISK/GAP Analysis
 - The model can be used to determine which techniques can be observed by which technology and where there might be risk since some gaps exist in detecting possible attack scenarios. Keywords are visibility and risk mitigation.
- RED Teaming
 - To determine the risk/gap analysis, often companies have a red-team in place that will conduct actor role playing. With the knowledge and skills of adversaries and known tools/techniques and procedures used in historical events, the team will execute these scenarios against the organization.
- SOC Assessment
 - At the same time as the red-teaming exercise is executed, the soc-team will be tested on maturity. Will the attacks being detected, which products would give me the visibility, what is the story these discovered techniques are telling me and what if we missed events?
- Threat Hunting

Connecting the dots

Recap

- Incident Response allows to limit the damage of a Security Incident
- Threat Intelligence allows to be proactive in threat research to protect the network and system.
- Incident Response and Threat Intelligence are complementary

Law Enforcement Collaboration

Law enforcement engagement can help reduce incident response times

Case study: Data theft from a Billion dollar International company. The company is being extorted with the disclosure of sensitive data.

- CISO'S QUESTIONS
 - How did they get in?
 - What data is gone? Where did it go?
 - If we pay, will it stop?
- Actions by Law Enforcement
 - Seizing infrastructure involved
 - Preserving valuable data
 - Established what was stolen and provided Strategic Intel.

Law Enforcement as an offensive counter measure

Internet service provider under DDoS Attack

Aug 2015 the biggest cable company in the Netherlands was attacked, resulting in an internet outage for 2,5 million customers.

- Actors claiming to be Anonymous extorted the company
- Security team of Liberty Global did a emergency migration of infrastructure and system hardening
- International media attention
- Law enforcement served an deterrence and public reassurance.
- First arrests with in a week, in 1 month time the rest of the group.

“Security is more powerful when
Private sector and Law Enforcement
are working together”

Might even apply to hunting pirates ;-)

Hunting Like a Sir

Agenda

- How to Hunt?
- What is YARA?
- Basic Rules
- Managing Dataset
- How to build a string and code rule
- VTHunting

What is Threat Hunting?

Threat hunting is the process of proactively looking for new threats and studying threat actors behaviors and methods.

How to Hunt?

Examples

- Malware
 - IMPhash
 - Certificate
 - Unique Mutex names
 - RichPE header
 - Unique strings
 - PDB path
 - Code similarity of blocks of code...
- Domain/IP:
 - Seen before in campaigns?
 - Who registered it / owns it
 - Is name equal to victim related registered domains
 - What code is present on the domain...

ImpHash

- ImpHash is a fingerprint of PE Import Address Table

```
import pefile
file = pefile.PE('tasksche.exe')
file.get_imphash()
'68f013d7437aa653a8a98a05807afeb1'
```

What Is Yara?

- YARA is a tool aimed at (but not limited to) helping malware researchers to identify and classify malware samples.
- With YARA you can create descriptions of malware families (or whatever you want to describe) based on textual or binary patterns.

<https://virustotal.github.io/yara/>

Writing YARA Rules

Example

```
rule silent_banker : banker
{
  meta:
    description = "This is just an example"
    thread_level = 3
    in_the_wild = true

  strings:
    $a = {6A 40 68 00 30 00 00 6A 14 8D 91}
    $b = {8D 4D B0 2B C1 83 C0 27 99 6A 4E 59 F7 F9}
    $c = "UVODFRYSIHLNWPEJXQZAKCBGMT"

  condition:
    $a or $b or $c
}
```

Keywords

Rule identifier

Meta information

Strings definition section

Condition

Yara Modules

PE Module

```
import "pe"
rule Is_DLL
{
    condition:
        pe.characteristics & pe.DLL
}
```

Hash Module

```
import "hash"
rule simple_hash_rule
{
    condition:
        hash.md5(0, filesize) == "7c3d183ed1f9008eea7ba5d8a8fd21d7"
}
```

Hunting with ImpHash

```
import "pe"
rule Check_imphash
{
    condition:
        pe.imphash == "44698852dc2c3447fc5207d6d6a42d0a"
}
```

Hunting with RichHash

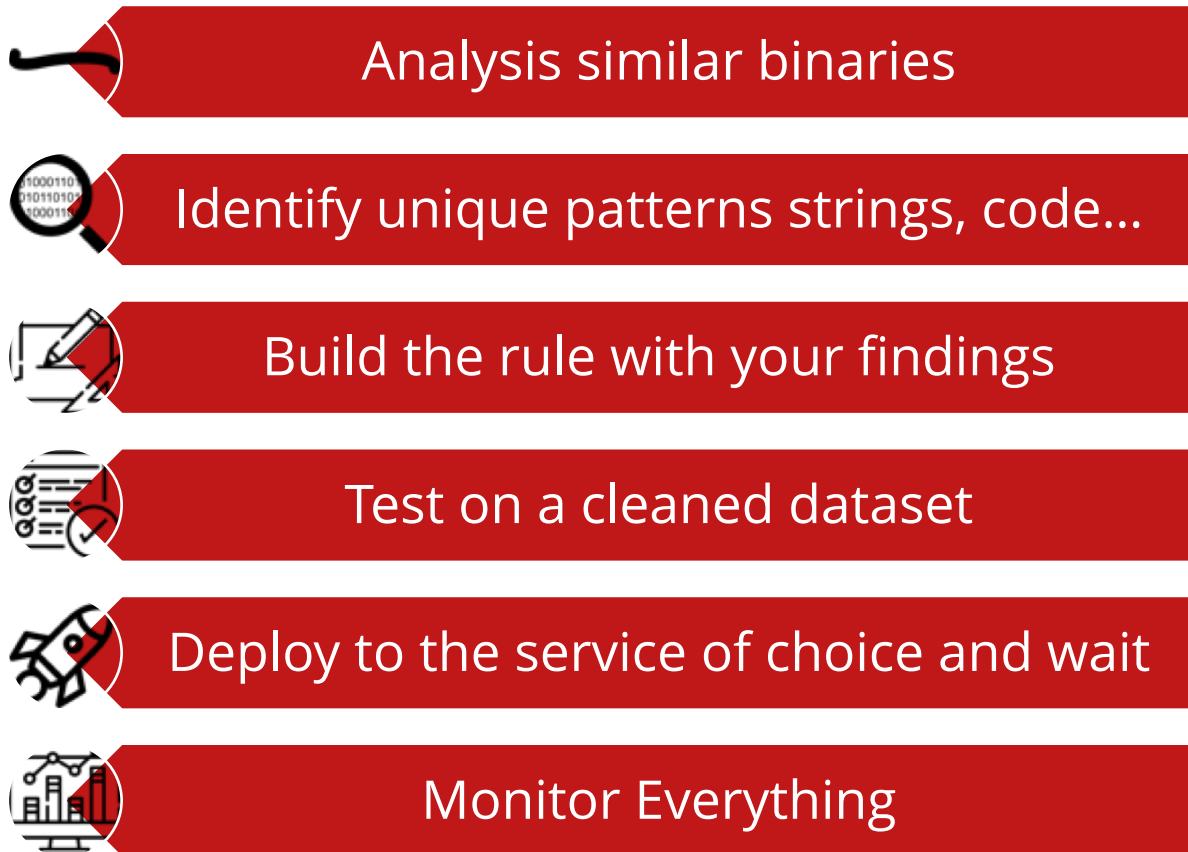

```
rule sodin_richhash {
  meta:
    description = "Rule to detect sodinokibi with Rich PE Hash"
  condition:
    hash.sha256(pe.rich_signature.clear_data) ==
    "ceb177d473a8c58fac3282d8ffdec81a58c602d14b5b936dc7124f4b51bfeb49"
}
```

Data source

- Virus Total
- Virusbay
- Malpedia
- Open source data

Yara Rule process creation

Strings Rule and Code Rule

```
rule Test_STR
{
  strings:
    $m1 = "onion"
    $m2 = "Offset"
    $m3 = "3FZbgicpjq2GjdwV8e"
  condition: 2 of ($m1,$m2,$m3)
}
```

```
rule Test_Hex
{
  strings:
    $hex_string = {DE AD BE EF}
  condition:
    $hex_string
}
```

YaraGenerator

```
python yaraGenerator.py ../ransomware/sodinokibi/ -r sodin_test -f exe
```

```
rule sodin_test
{
  strings:
    $string0 = "7777mmmm"
    $string1 = "pppp>>>>"
    $string2 = "Lj66lZ"
    $string3 = "55j_WW"
    [truncated]
    $string15 = "xxJo%%\\r..8$"
    $string17 = "YYYYGGGG"
    $string18 = "kkkkoooo"
  condition:
    18 of them
}
```

VTHunting Tool

What is VTHunting?

- VTHunting is a tiny tool coded in Python
- Used to collect Malware Hunting Report from VirusTotal
- Centralize reports notification in one place

Disclaimer: You need a VirusTotal Intelligence API

<https://github.com/fr0gger/vthunting>

VTHunting Tool

Vthunting Functionnalities

CLI Report

Slack Report

Telegram Report

Email Report

VTHunting Tool

How to use it?

- Configuring with cron to generate daily, weekly or monthly report

```
# Example of job definition:
# .----- minute (0 - 59)
# | .----- hour (0 - 23)
# | | .----- day of month (1 - 31)
# | | | .----- month (1 - 12) OR jan,feb,mar,apr ...
# | | | | .---- day of week (0 - 6) (Sunday=0 or 7) OR sun,mon,tue,wed,thu,fri,sat
# | | | | |
# * * * * * user command to be executed

15 10 * * * /usr/local/bin/vthunting -r -t -e -s >> vthunt.log
```

VTHunting Tool

Report Example

Recap

- Multiple ways to identify code similarity
- Be aware to false flags
- Yara hunting with code and/or strings
- Vthunting to automate your threat hunting

Thank you!

Thomas Roccia, Security Researcher, ATR

McAfeeTM

Together is power.
